Parallel Digital Signal Processing An Emerging Market
Parallel multidimensional digital signal processing is defined as the application of parallel programming and multiprocessing to digital signal processing techniques to process digital signals that have more than a single dimension. The use of mD-DSP is fundamental to many application areas such as digital image and video processing, medical imaging, geophysical signal analysis, sonar, radar, lidar, array processing, computer vision, computational photography, and augmented and virtual reality.

Simply put, parallel processing uses multiple processors working together to solve a single task. Processors can either solve different portions of the same problem simultaneously or work on the same portion of a problem concurrently. This paper discusses digital signal parallel processing as well as the reasons why DSP and parallel

PARALLEL DIGITAL SIGNAL PROCESSING: AN EMERGING MARKET
In digital signal processing, parallel processing is a technique duplicating function units to operate different tasks simultaneously. Accordingly, we can perform the same processing for different signals on the corresponding duplicated function units. Further, due to the features of parallel processing, the parallel DSP design often contains multiple outputs, resulting in higher throughput than not parallel.

A digital signal processor (DSP) is a specialized microprocessor (or a SIP block), with its architecture optimized for the operational needs of digital signal processing. The goal of DSP is usually to measure, filter or compress continuous real-world analog signals. Most general-purpose microprocessors can also execute digital signal processing algorithms successfully, but may not be able to keep up with such processing continuously in real-time.

Terminology. The terms multi-core and dual-core most commonly refer to some sort of central processing unit (CPU), but are sometimes also applied to digital signal processors (DSP) and system on a chip (SoC). The terms are generally used only to refer to multi-core microprocessors that are manufactured on the same integrated circuit die; separate microprocessor dies in the same package are ...
